LYSAGHT FIRMLOK® STRUCTURAL BEAMS

1. General Data

1.1 FIRMLOK® STRUCTURAL BEAMS

FIRMLOK® structural beams consist of two interlocking C-sections. They are light, strong and universal in their application. A range of connection types and accessories allows you to erect your project with ease.

FIRMLOK® is uniform in quality, it doesn't warp or split and it doesn't need painting. Consistent straightness simplifies alignment. LYSAGHT FIRMLOK® beams are available in three sizes 100mm, 150mm and 200mm deep depending on your application and aesthetic preference.

This publication demonstrates FIRMLOK® in its application as roofing members, combined with our range of roof sheeting. Typical applications include patios, carports and awnings.

MATERIAL SPECIFICATIONS

Next generation ZINCALUME® aluminium/zinc/magnesium alloy coated steel complies with AS 1397:2011 G550, AM125 (550 MPa minimum yield stress, 125g/m² minimum coating mass).

COLORBOND® is pre-painted steel for exterior roofing and walling. It is the most widely used. The painting complies with AS/NZS 2728:2013 and the steel base is an aluminium/zinc alloy-coated steel complying with AS 1397:2011. Minimum yield strengths are G550 (550 MPa). Minimum coating mass is AM100 (100g/m²).

The base metal thicknesses are 0.55, 0.75 and 1.00mm.

COLOURS

FIRMLOK® beams are available in ZINCALUME® steel and a range of COLORBOND® steel colours.

The FIRMLOK® universal brackets are also available powder coated to match the COLORBOND® steel colours.

LENGTHS

Stock lengths may vary from state to state. Please enquire at your local distribution outlet for available lengths.

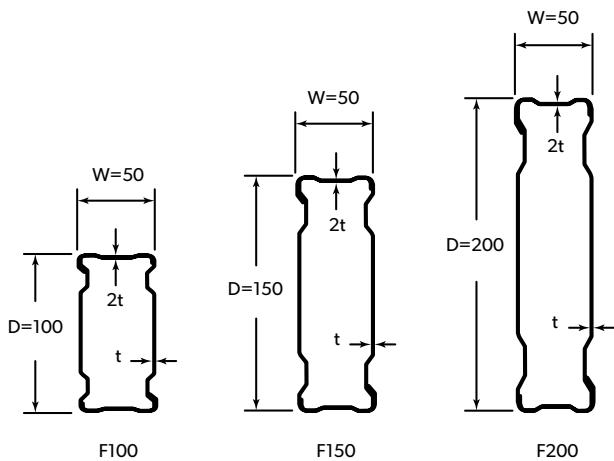

Alternatively, FIRMLOK® may be ordered to length (maximum length at 12000mm). Extended lead times may apply.

FIRMLOK® SECTION PROPERTIES

FIRMLOK® Section	Mass	Nominal Dimension	Web Thickness	Full Section Area	Moment of Inertia	Section Modulus	Radius of Gyration			
	ZINCALUME®/ (COLORBOND®)	D x W	t	A	I _x	I _y	Z _x	Z _y	r _x	r _y
F10011	kg/m	mm	mm	mm ²	mm ⁴	mm ⁴	mm ³	mm ³	mm	mm
F10011	1.87 (1.90)	100 X 50	0.55	234	347000	81000	7050	3230	38.5	18.6
F15015	3.13 (3.17)	150 X 50	0.75	393	1256000	152000	16910	6068	56.5	19.7

Notes:

1. Depth and width are nominal dimensions.
2. All section properties are based on gross section.

IDENTIFICATION

The format of the number code is:

F xxx xx

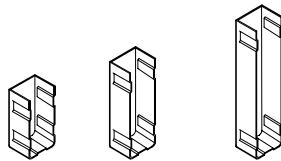

F = FIRMLOK®

xxx = Section depth D (mm)

xx = 2 t x 10 (mm)

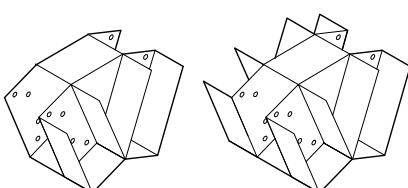

1.2 FIRMLOK® COMPONENTS

Not all components available in all regions – contact your nearest Lysaght branch for more information.

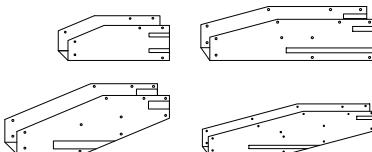

Universal Connector

FLUB100ZL05 – 100 purlin / rail
FLUB150ZL05 – 150 purlin / rail
FLUB200ZL05 – 200 purlin / rail

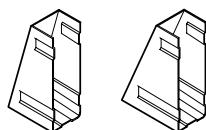

Delta Integrated Connector (22.5° pitch only)

CC10 – 100 rafter & purlin, end frame
CC15X – 150 rafter & purlin, end frame
CCD10 – 100 rafter & purlin, internal frame
CCD10X – 150 rafter & purlin, internal frame

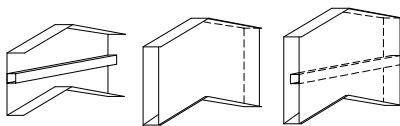

Collar-tie Connector

CTC10 – 22.5° pitch, 100 collar-tie
CTC15 – 22.5° pitch, 150 collar-tie
CTC1015 – 15° pitch, 100 collar-tie
CTC1515 – 15° pitch, 150 collar-tie

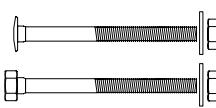

Rafter Connector

FLUB100ZL15 – 15° pitch, 100 rafter
FLUB150ZL15 – 15° pitch, 150 rafter
FLUB200ZL15 – 15° pitch, 200 rafter
FLUB100ZL225 – 22.5° pitch, 100 rafter
FLUB150ZL225 – 22.5° pitch, 150 rafter
FLUB200ZL225 – 22.5° pitch, 200 rafter

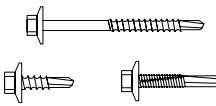

Apex Connector

FLAB100Z15 – 15° pitch, 100 rafter
FLAB150Z15 – 15° pitch, 150 rafter
FLAB200Z15 – 15° pitch, 200 rafter
FLAB100Z225 – 22.5° pitch, 100 rafter
FLAB150Z225 – 22.5° pitch, 150 rafter
FLAB200Z225 – 22.5° pitch, 200 rafter

Bolt

M8/M10 cup/hex head bolts,
standard /Nylock nut & washer,
Grade 4.6 / S

Metal screw

12g-14x20mm hex head tek
12g-24x32mm hex head tek
12g-14x80mm hex head tek

Note: for cladding fasteners, refer to cladding section of this document.

Some component are subjected to availability, check with your local Lysaght branch.

1.3 FIRMLOK® QUICK SELECTION TABLES

INTRODUCTION

FIRMLOK® "Quick Selection Tables" provide an easy tool for determining the roof layout of your structure, using FIRMLOK® beams and lysaght cladding.

This guide is divided into sections: Cladding Selection, Flat Structures and Pitched Structures. Each section comprises of diagrams and span tables. The diagrams assist with selecting your structure type and the tables determine the size of each member based on loading.

When using the Quick Selection Tables, member designation is important.

- Purlins run at 90° to the ribs of your cladding and the cladding is screwed to them.
- Rafters generally run parallel to the ribs on your cladding and have purlins attached
- Headbeams support the upper and lower edge of the roof and are supported by posts.

USING QUICK SELECTION TABLES

The Quick Selection tables have been developed to be comprehensive and flexible, whilst remaining easy to use. The three sections allow you to design most typical structures with little effort.

Note: The sections for free-standing structures can be used to design similar attached structures, provided correct design of attachment to existing structure is performed.

To begin, you will need to determine:

Structure Type (Flat or Pitched): This will indicate which section of the "Quick Selection Tables" is appropriate to your design.

Wind classification (N1, N2, N3 or N4) and wind blocking:

It is important to know the wind class for your area and structure. Refer to Australian Standards AS4055 - 2012 Wind loads for housing for wind classification. Alternatively, seek guidance from a qualified engineer or builder.

Structure size: The structure size is the overall width and length of the intended structure in plan view.

This is all the information you need to begin designing your structure. An experienced user will have no problems using the tables to design each structure. You may wish to refer to the example at the end of each section.

Attached Flat Structure

Free-standing Flat Structure

Attached Pitched Structure

1.4 DESIGN CONDITIONS AND NOTES FOR THE TABLES

GENERAL

This document is an engineering aid to help in the design of carports, awnings and patio covers by designers. This document gives all the information to design an economical structure based on the wind classification, wind blocking and geometry of the structure.

DESIGN STANDARDS

FIRMLOK® "Quick Selection Tables" have been prepared in accordance with the appropriate Australian Standards. Cladding, beam and connection capacities are based on limit state design and testing at LYSAGHT® Research and Technology. The following standards have been referenced:

- AS/NZS 4600: 2005 Cold formed steel structures
- AS/NZS 1170.0 - 2002 Part 0: General principles
- AS/NZS 1170.1 - 2002 Part 1: Permanent, imposed and other actions
- AS/NZS 1170.2 - 2011 Part 2: Wind Actions
- AS 4055 - 2012 Wind loads for housing
- AS 1562.1 - 1992 Design and installation of sheet roof and wall cladding Part 1: Metal
- AS 4040.2 - 1992 Methods of testing sheet roof and wall cladding – Resistance to wind pressure for non-cyclonic regions
- NCC - Building code of Australia (BCA) (current edition)

WIND

The tables presented in this brochure are for attached/freestanding awnings and pitched structures in normal wind (non-cyclonic) for wind classifications N1, N2, N3 and N4.

Design Wind speeds and wind pressure coefficient factors used to calculate the design net pressures have been derived from AS/NZS 1170.2-2011: Structural Design Actions Part 2: Wind Actions. For residential application, the wind classification system from AS 4055-2012: Wind Loads for Housing has been adopted for user convenience. For each structural configuration, five wind loading situations have been considered:

1B - one side blocked, typically attached to one side of an existing house or 0/4 sides blocked.

2B - two sides blocked, typically attached to two sides of an existing house

3B - three sides blocked, typically attached to three sides of an existing house; a "U" shaped configuration.

The structures with flat roof must have a roof slope greater than 2 degs and no greater than 10 degrees. Roof slopes higher than 10 degrees may experience greater wind loads than used in the design. Pitched roofs have been designed for 15 and 22.5 degrees.

WIND CLASSIFICATION NOTATION TO AS 4055 & NCC-BCA

NCC - BCA	Legacy Wind Speed Class	Permissible Wind Stress Notation	Serviceability Wind Speed V _p (m/s)	Ultimate Wind Speed V _s (m/s)	Ultimate Wind Pressure (kPa)
N1	W28	28	26	34	0.69
N2	W33	33	26	40	0.96
N3	W41	41	32	50	1.50
N4	W50	50	39	61	2.23

LOADS

The structure is designed for the following loads:

- Wind Loads: as described above.
- Dead Loads: Self weight of both sheeting and FIRMLOK® beam have been considered. No allowance for ceilings or other dead loads uniformly distributed or point loads have been made.
- Live Loads: A Live Load of 0.25 kPa has been considered on the beams. A concentrated live load of 1.1kN factored up, has been considered on each beam individually.

DEFLECTION

Deflection limits adopted for the design of FIRMLOK® beams are:

- Dead Load: Span/300 for beams with a maximum of 20mm
- Wind Load: Span/150 for serviceability wind pressure
- Live Load: Not Applicable

ATTACHED AND FREESTANDING AWNINGS

The capacity of the existing structure to withstand the additional loads arising from the attached awning must be verified by a competent person, an engineer or builder. It's advised to check with your local government authority to determine any specific requirements or rules for the attachment to existing structures.

Awnings have not been designed to account for any additional rainwater runoff, other than that falling directly onto its roof area. Rainwater must not be distributed from existing roofs onto the awning.

The quick selection tables have been created based on design and tested using LYSAGHT® components.

CONNECTIONS FOR STRUCTURES

When a beam is designed for strength, the connection at the ends of the beam must be checked against its strength. There are several connection types which are considered in the span tables. Beams are always connected to each other with FIRMLOK® universal connectors. These brackets connect to the beams basically with a bolt and one or two teks to the supported beam or post.

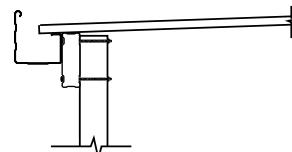

Bolts are used on the beam to beam connectors to distribute the load to the two sides of the supporting beam. The bolts are used with the post to take the higher loads from big spanning beams. The connection capacities for beams are based on a member supported by a member of the same size. If the supporting member is bigger the connection capacity may be stronger than indicated in the tables.

There are two main types of connections for beams to posts: Post behind beam using bolts and Post to side of beam using brackets. The connection capacities are based on extensive testing at our NATA registered laboratory.

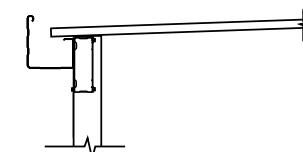

For pitched structures, portal frame rafter and collar-tie truss frames and their immediate supports (e.g. post, existing structure etc.) are assumed to be connected as simple, moment free pinned connections.

Portal frame rafters are assumed to be laterally restrained by purlins only at eave, apex and internally where indicated on the relevant diagrams.

Post behind beam - bolted

Post to side of beam with brackets

PART A

2.0 Cladding

2.1 CLADDING SELECTION

- The tables presented in this section are for non-cyclonic conditions only.
- Wind Loads: Design Wind speeds have been based on the classification system used in AS4055:2012. Factors used to calculate the design net pressures have been derived from AS1170.2:2011. Five wind blocking cases relevant to home improvement structures have been considered.
- Flat roofs must have a roof slope no greater than 10 degrees and no less than 2 degrees. Roof slopes beyond 10 degrees may experience greater wind loads than have been designed for. Refer to the minimum roof pitch table.
- Pitched roofs have been designed for two slopes, 15 and 22.5 degrees.
- Dead Loads: Self weight of sheeting only has been considered.
- Live Load: No general live load has been used. As the sheet spans are for 'No Foot Traffic', i.e. no person is allowed to walk on the sheeting. Where spans have been reduced for foot traffic, the sheeting has been tested for a person weighing up to 110kg. Where the spans are used for no foot traffic, a sign should be attached to the inside of the beams.

The tables give the spans for wind pressure, termed "foot traffic - NO" and the span for foot traffic, termed "foot traffic - YES". The sheeting has been tested in accordance to AS 4040.2 with serviceability deflection limit of Span/120 + Fastener Pitch/30. LYSAGHT FLATDEK® cladding spans may result in noticeable deflections under maximum loads. In situations where deflections are deemed critical, spans should be reduced to the walkable spans e.g. in a screen room.

NON-CYCLONIC AREAS

The information in this section for cladding is suitable for use only in areas where a tropical cyclone is unlikely to occur as defined in AS 1170.2:2011.

CLADDING AVAILABILITY

Not all sheeting available nationally. Please check availability with your local Lysaght branch.

MINIMUM ROOF PITCH AND MAXIMUM SHEET OVERHANG

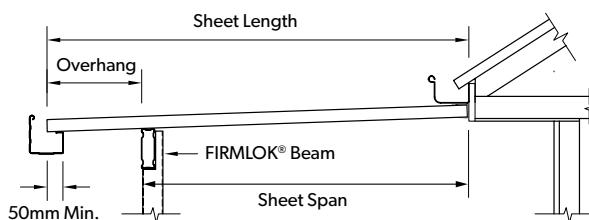

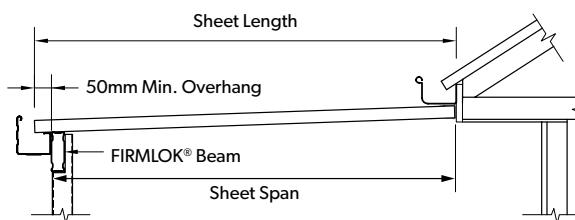

Lysaght Roofing	Minimum Fall (mm/m) / Roof Pitch	Maximum overhang No foot traffic** (mm)
0.42mm CUSTOM ORB®	50 / 3°	300
0.40mm CUSTOM ORB ACCENT 21®	50 / 3°	400
0.42mm SPANDEK®	35 / 2°	630
0.42mm TRIMDEK®	35 / 2°	430
0.42mm FLATDEK® *	25 / 1.5°	630
0.42mm FLATDEK® II *	35 / 2°	630
0.48mm KLIP-LOK® 406	25 / 1.5°	600
0.42mm KLIP-LOK CLASSIC® 700	25 / 1.5°	530
0.42mm KLIPLOK 700HS	25 / 1.5°	530

* To achieve 1.5° pitch, it is recommended to build a gutter around the perimeter of the flat roof.

** These spans are only applicable for overhanging sheets attached with a gutter or an angle stiffener.

For gutter and roof maintenance, always walk on the support beams, do not walk on the sheets overhang or use the overhang sheets as support. See diagrams below. Maximum roof pitch for a flat structure is 10°. The maximum span for maintenance foot traffic on sheet overhang is 100mm for all sheets.

Notes:

At side-laps, pan fix to female rib. For wide pan cladding such as FLATDEK® or KLIP-LOK®, position 1 fastener at centre and 1 fastener next to the rib in each pan. If translucent sheeting is used as light panels, there must be at least 2 metal sheets between each translucent sheet. The light panels must be stitched to the side of the metal sheets if the spans from the tables are used.

TRIMDEK® 0.42 *	2700	2000	2400	1300	2100	2000	2100	1300

Notes:

- All spans are in mm.
- The "No Foot Traffic" span range is designed for the condition where no person is allowed to walk on the roof. The design criteria includes deflection due to self weight, maximum wind pressure and fastener capacity based on FIRMLOK® beams. A sticker must be placed on the supporting beams which has the No Foot Traffic sign on it.
- The 'FOOT TRAFFIC' spans were derived from testing carried out for home improvement type structures only. The foot traffic spans have been tested for a person with a weight up to 110kg. This design criteria is different to the testing criteria in AS 4040.1:1992.
- The above tables can be used for sheets with bigger thickness of the same LYSAGHT® profile and material specification.
- All sheeting materials are G550 grade steel with COLORBOND® or ZINCALUME® steel.
- For cladding with foot traffic, use the smaller of the two spans given in the tables (YES = foot traffic, NO = no foot traffic).
- For more details on LYSAGHT® claddings, refer to the individual product brochures by visiting www.lysagh.com.
- *KL700HS, if sheet span ≥ 2400mm, provide 1 rivet/screw at the side-lap at mid-span to keep sheets together.
*TRIMDEK® & SPANDEK®, if sheet span ≥ 2000mm, provide 1 rivet/screw at the side-lap at mid-span to keep sheets together.
*CUSTOM ORB®, if sheet span ≥ 1500mm, provide 1 rivet/screw at the side-lap at mid-span to keep sheets together.

Notes:

1. All spans are in mm.
2. The "No Foot Traffic" span range is designed for the condition where no person is allowed to walk on the roof. The design criteria includes deflection due to self weight, maximum wind pressure and fastener capacity based on FIRMLOK® beams. A sticker must be placed on the supporting beams which has the No Foot Traffic sign on it.
3. The 'FOOT TRAFFIC' spans were derived from testing carried out for home improvement type structures only. The foot traffic spans have been tested for a person with a weight up to 110kg. This design criteria is different to the testing criteria in AS 4040.1:1992.
4. The above tables can be used for sheets with bigger thickness of the same LYSAGHT® profile and material specification.
5. All sheeting materials are G550 grade steel with COLORBOND® or ZINCALUME® steel.
6. For cladding with foot traffic, use the smaller of the two spans given in the tables (YES = foot traffic, NO = no foot traffic).
7. For more details on LYSAGHT® claddings, refer to the individual product brochures by visiting www.lysaght.com.
8. *KL700HS, if sheet span ≥ 2400mm, provide 1 rivet/screw at the side-lap at mid-span to keep sheets together.
*TRIMDEK® & SPANDEK®, if sheet span ≥ 2000mm, provide 1 rivet/screw at the side-lap at mid-span to keep sheets together.
*CUSTOM ORB®, if sheet span ≥ 1500mm, provide 1 rivet/screw at the side-lap at mid-span to keep sheets together.

- *CUSTOM ORB®, if sheet span ≥ 1500mm, provide 1 rivet/screw at the side-lap at mid-span to keep sheets together.

PART B

3.0 Flat Structures

3.1 QUICK SELECTION TABLES

There are several tables based on the type of member and the way it is loaded together with the connection at the end of the beam. The tables are used to give the span of FIRMLOK® beams for different wind classifications and wind blocking based on the applied load and the load width. The table is organised as shown below:

EXTRACT FROM A SPAN TABLE

Wind Blocking	Wind Class	Beam Size	Load Width (mm) 3000
0/1/4 sides	N1/N2	F100	4800, 1.0
		F200	7500, 1.5 ←
		F300	9250, 2.0 →

Maximum beam span.

Reaction load at the end of the beam. This is used to work out the total load for the support.

The width of loading to be supported by the selected beam.

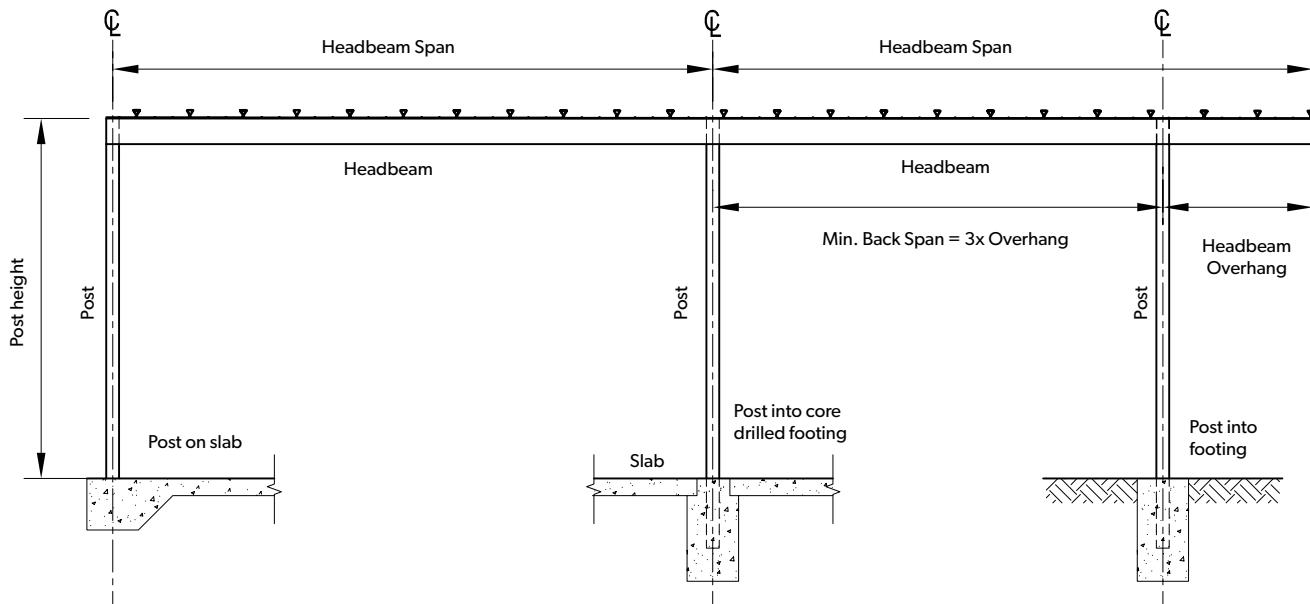

HEADBEAM OVERHANG

Headbeams can have overhang and are tabulated for beams supporting sheeting only. A bolted post behind connection must be used to overhang the headbeam past the supporting post. The headbeam span must be the span shown in the diagram to get the strength of the beam. With this span the post can be moved in creating the overhang. This distance can only be up to the span/4 (one quarter of the span). The maximum overhang each beam can have is given in the overhang table.

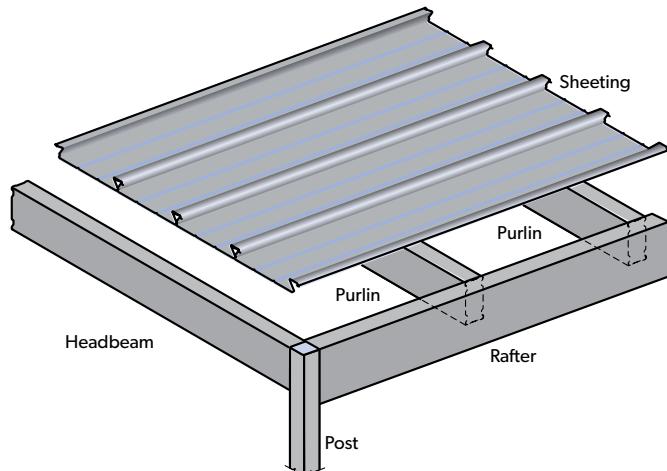

HEADBEAM OVERHANG (MM)

FIRMLOK® Beam Size	Maximum Overhang
F100	1000
F150	1250
F200	1750

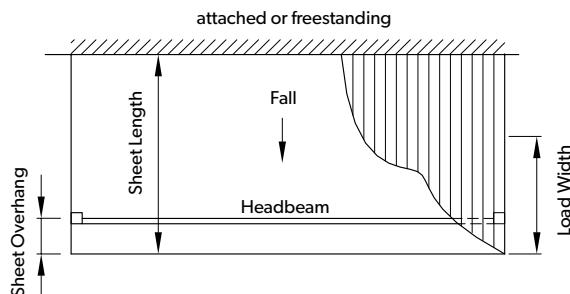

For supporting cladding only.

Basic Terminology

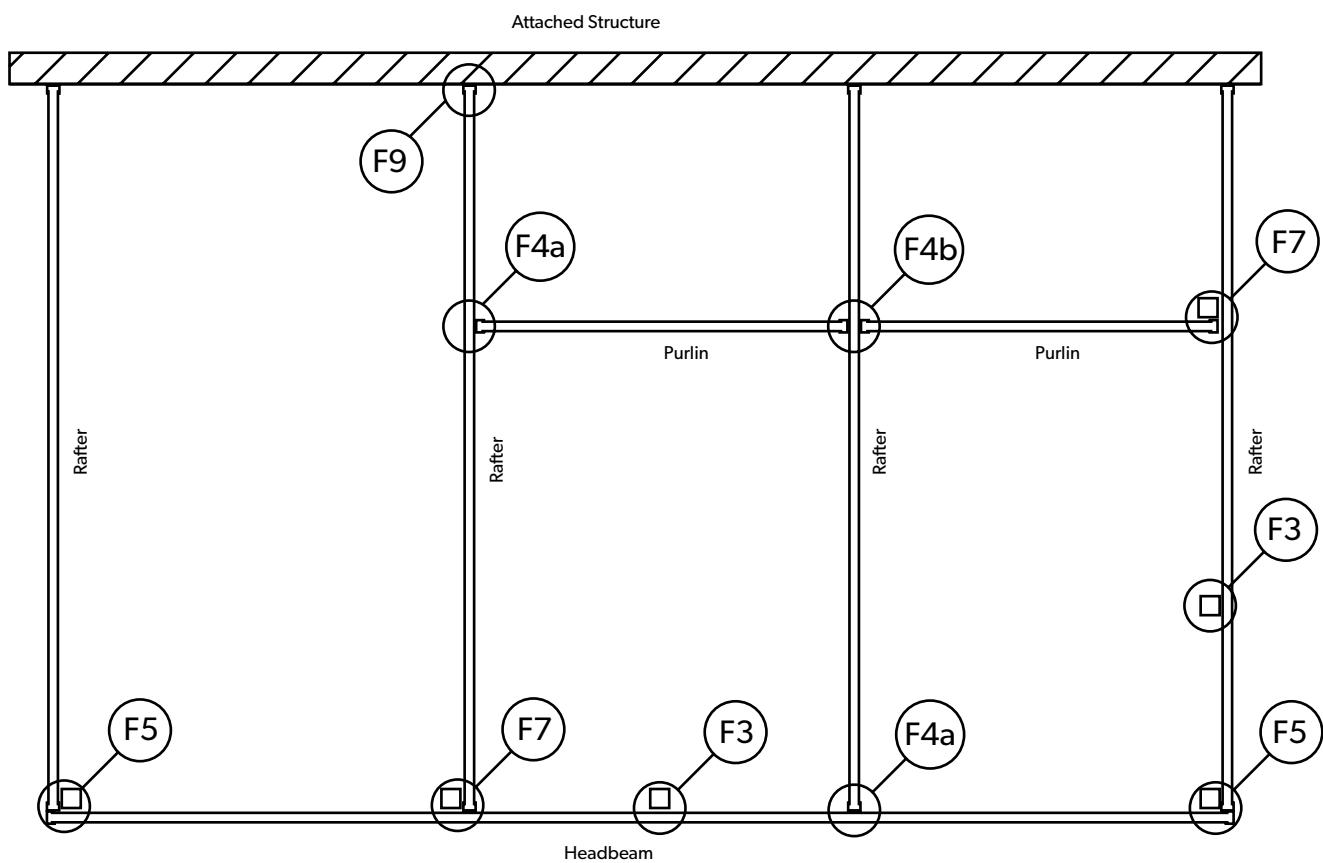

Sheet Overhang

3.2 KEY PLANS FOR FLAT STRUCTURES

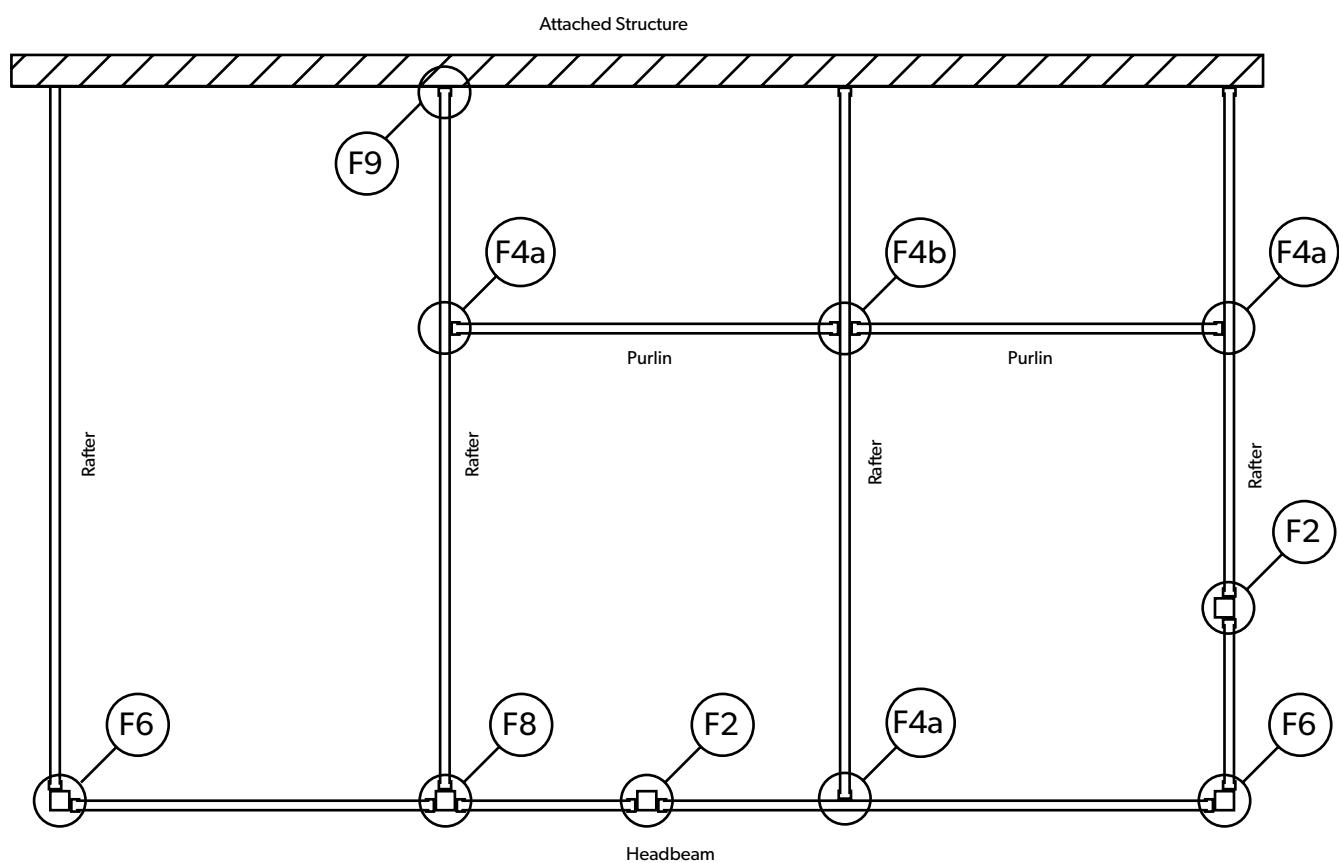

Post Behind Beam Connections

For typical beam to bracket detail, refer to connection F1 on the following pages.

Beam to Side of Post Connections

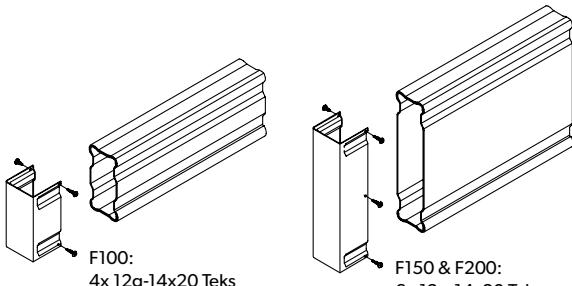

For typical beam to bracket detail, refer to connection F1 on the following pages.

Notes:

1. All screws are self drilling metal Hex Head Tek® 12g-14x20 i.e. 12 gauge with 14 TPI, 20 long U.N.O. Values given are: gauge - threads per inch x length in mm. Tek is a trademark of Buildex.
2. The finish for all Tek is Coating Class 4.
3. All bolts are galvanised M8 steel for beam to beam & beam to side of post connection, Grade 4.6 snug-tight.
4. All bolts are galvanised M10 steel for connections to posts, Grade 4.6 snug-tight.
5. Bolts are either hex head or cuphead; see connection details.
6. Use standard nut and washer in Non-cyclonic areas & Nylock nuts in Cyclonic areas.

3.4 TABLE INDEX

FLAT STRUCTURES - ATTACHED AND FREE STANDING

Table	Beam	Span Type	Supporting	Connection
1	Purlin	Simply supported	Sheeting	Beam to side of beam/post
2A	Headbeam	Simply supported	Sheeting	Beam to side of post
2B	Headbeam	Simply supported	Sheeting	Post bolted behind beam
2C	Headbeam	Multiple continuous	Sheeting	Beam to side of post
3A	Rafter	Simply supported	1 Purlin	Beam to side of post Post bolted behind beam
3B	Rafter	Simply supported	2 Purlins	Beam to side of post Post bolted behind beam
3C	Rafter	Double continuous	1 Purlin	Beam to side of post
3D	Rafter	Double continuous	2 Purlins	Beam to side of post

4B	Headbeam	Simply supported	2 Rafters	Beam to side of post Post bolted behind beam
5	Attachment load	Simply supported	0 Rafters	Attached to fascia or wall

3.5 QUICK SELECTION TABLES

Table 1

Purlin Span and Reaction. Span Type: Simply Supported. Connection: Bracket. Supporting: Sheeting. Flat Structure

Diagram 1

Purlin supporting sheeting.

Wind Blocking**Wind Class****Beam Size****Purlin Load Width (mm)****Purlin Size****Load Width****Sheet Span****Fall****Purlin Span****General Notes:****1. A simply supported beam means the beam spans between 2 supports (posts or beams).****2. A continuous beam means the beam spans past at least 1 internal posts (i.e. beam on 3 or more posts).****3. A purlin is a beam which supports sheeting only.****4. A rafter runs down the slope (fall) and supports purlins.****5. A headbeam supports the lower edge of the roof where the gutter is located.****6. The connection column gives how the beam is supported e.g. by a universal bracket bolted to the side of the post or the beam is bolted with the post behind the beam.****7. The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.****8. The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.****1. For intermediate load width, use interpolation between the values of the same category.****2. The 1st value in the table is the purlin span in mm, the 2nd value in the table is the reaction (kN) on the supporting rafter.****3. The reaction is based on 1 purlin span and 2 rafter supports. For 2 or more simply span purlins, double (2x) the reaction for internal rafters.****4. Purlin span = spacing of rafters.****5. Values from 1 sided blocked can be conservatively used for 0 and 4 sides wind blocking.**

Table Notes:

1. For intermediate load width, use interpolation between the values of the same category.

2. The 1st value in the table is the headbeam span in mm, the 2nd value in the table is the tensile reaction (kN) on the support (post).

3. The post reaction is based on 1 headbeam span and 2 supports. For 2 or more simply span headbeams, double (2x) the post reaction for internal posts.

4. Headbeam span = spacing of supports.

5. Values from 1 sided blocked can be conservatively used for 0 and 4 sides wind blocking.

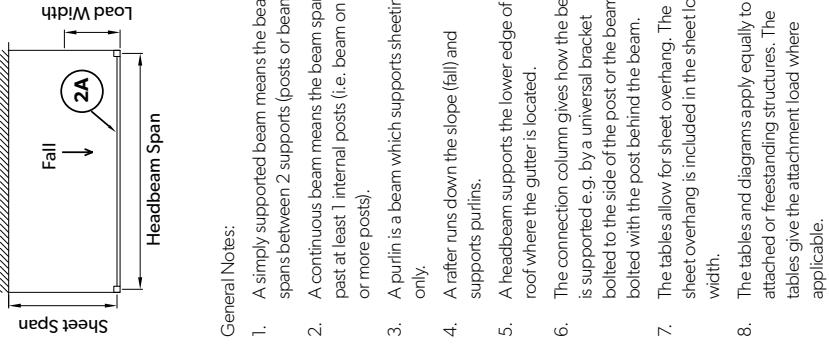

Table 2B

Headbeam Span and Reaction, Span Type: Simply Supported, Connection: Bolted, Supporting: Sheeting, Flat Structure

Diagram 2B

Headbeam, no rafters post bolted behind.

Table Notes:

- For intermediate load width, use interpolation between the values of the same category.
- The 1st value in the table is the purin span in mm, the 2nd value in the table is the tensile reaction (kN) on the support (post).
- The post reactions in Table 2C are based on the reaction in an internal support of 2 equal continuous spans with 3 supports. For end posts, multiply the post reaction in table 2C by 0.4.
- Headbeam span = spacing of supports.
- Attachment load is the uniformly distributed load in kN/m acting on the attachment structure e.g. existing wall.
- Values from 1 sided blocks can be conservatively used for 0 and 4-sides wind blocking.

- General Notes:
- A simply supported beam means the beam spans between 2 supports (posts or beams).
 - A continuous beam means the beam spans at least 3 internal posts (i.e. beam on 3 or more posts).
 - A purin is a beam which supports sheeting only.
 - A rafter runs down the slope (fall) and supports purins.
 - A headbeam supports the lower edge of the roof where the gutter is located.
 - The connection column gives how the beam is bolted to the side of the post or the beam is bolted with the post behind the beam.
 - The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.
 - The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.

Table Notes:

1. For intermediate load width, use interpolation between the values of the same category.

2. The 1st value in the table is the rafter span in mm, the 2nd value in the table is the tensile reaction (kN) on the support (post).

3. The support reaction is based on 1 rafter span and 2 supports.

4. Rafter span = spacing of supports.

General Notes:

1. A simply supported beam means the beam spans between 2 supports (posts or beams).

2. A continuous beam means the beam spans past at least 1 internal posts (i.e. beam on 3 or more posts).

3. A purlin is a beam which supports sheeting only.

4. A rafter runs down the slope (fall) and supports purlins.

5. A headbeam supports the lower edge of the roof where the gutter is located.

6. The connection column gives how the beam is supported e.g. by a universal bracket bolted to the side of the post or the beam is bolted with the post behind the beam.

7. The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.

8. The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.

General Notes:

1. A simply supported beam means the beam spans between 2 supports (posts or beams).
2. A continuous beam means the beam spans past at least 1 internal post (i.e., beam on 3 or more posts).
3. A purlin is a beam which supports sheeting only.
4. A rafter runs down the slope (fall) and supports purlins.
5. A headbeam supports the lower edge of the roof where the gutter is located.
6. The connection column gives how the beam is supported e.g. by a universal bracket bolted to the side of the post or the beam is bolted with the post behind the beam.
7. The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.
8. The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.

Table Notes:

1. For intermediate load width, use interpolation between the values of the same category.
2. The 1st value in the table is the rafter span in mm, the 2nd value in the table is the tensile reaction (kN) on the support (post).
3. The support reactions in the above table are based on the reaction in an internal support of a 2 equal continuous span beam with 3 supports. For end posts, multiply the post reaction in tables 3C by 0.4.
4. Rafter span = spacing of supports.
5. Values from 1 sided blocked can be conservatively used for 0 and 4 sides wind blocking.

Table 3D

Rafter Span And Reaction, Span Type: Double/Multiple Continuous, Connection: Bolted, Supporting: 2 Purlins, Flat Structure

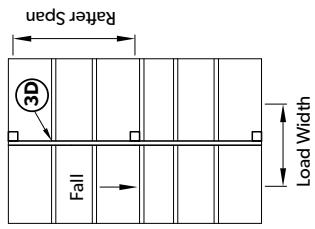

Diagram 3D

Continuous rafter supporting two purlins.

Table Notes:

- For intermediate load width, use interpolation between the values of the same category.
- The 1st value in the table is the rafter span in mm, the 2nd value in the table is the tensile reaction (kN) on the support (post).
- The support reactions in the above table are based on the reaction in an internal support of a 2 equal continuous span beam with 3 supports. For end posts, multiply the post reaction in tables 3D by 0.4.
- Rafter span = spacing of supports.
- Values from 1 sided blocked can be conservatively used for 0 and 4 sides wind blocking.

General Notes:

- A simply supported beam means the beam spans between 2 supports (posts or beams).
- A continuous beam means the beam spans past at least 1 internal posts (i.e. beam on 3 or more posts).
- A purlin is a beam which supports sheeting only.
- A headbeam supports the lower edge of the roof where the gutter is located.
- The connection column gives how the beam is supported e.g. by a universal bracket bolted to the side of the post or the beam is bolted with the post behind the beam.
- The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.
- The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.

Table Notes:

- For intermediate load width, use interpolation between the values of the same category.
- The 1st value in the table is the headbeam span (mm), the 2nd value in the table is the tensile reaction (kN) on the support (e.g. post).
- The support reaction is based on 1 span and 2 supports.
- Headbeam span = spacing of supports.
- Values from 1 sided blocked can be conservatively used for 0 and 4 sides wind blocking.

- General Notes:
- A simply supported beam means the beam spans between 2 supports (posts or beams).
 - A continuous beam means the beam spans past at least 1 internal posts (i.e. beam on 3 or more posts).
 - A purflin is a beam which supports sheeting only.
 - A rafter runs down the slope (fall) and supports purlins.
 - A headbeam supports the lower edge of the roof where the gutter is located.
 - The connection column gives how the beam is supported e.g. by a universal bracket bolted to the side of the post or the beam is bolted with the post behind the beam.
 - The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.
 - The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.

Table Notes:

- For intermediate load width, use interpolation between the values of the same category.
- The 1st value in the table is the headbeam span (mm), the 2nd value in the table is the tensile reaction (kN) on the support (e.g. post).
- The support reaction is based on 1 span and 2 supports.
- Headbeam span = spacing of supports.
- Values from 1 sided blocked can be conservatively used for 0 and 4 sides wind blocking.

- General Notes:
- A simply supported beam means the beam spans between 2 supports (posts or beams).
 - A continuous beam means the beam spans past at least 1 internal posts (i.e. beam on 3 or more posts).
 - A purflin is a beam which supports sheeting only.
 - A rafter runs down the slope (fall) and supports purlins.
 - A headbeam supports the lower edge of the roof where the gutter is located.
 - The connection column gives how the beam is supported e.g. by a universal bracket bolted to the side of the post or the beam is bolted with the post behind the beam.
 - The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.
 - The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.

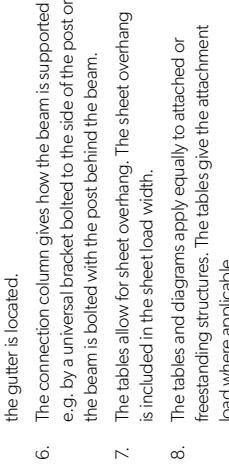

Table 5

Attachment Load, Flat Structure

Wind Blocking	Wind Class	Attachment Load Width (mm)												
		≤ 900	1200	1500	1800	2100	2400	2700	3000	3300	3600	3900	4200	4500

	N4	2.4	3.1	3.9	4.7	5.5	6.3	7.1	7.9	8.7	9.5	10.3	11	11.8

Table Notes:

- Attachment load is the uniformly distributed load in kN/m acting on the attachment structure e.g. existing wall.

General Notes:

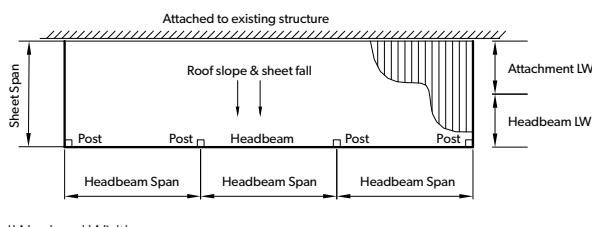

- A simply supported beam means the beam spans between 2 supports (posts or beams).
- A continuous beam means the beam spans past at least 1 internal posts (i.e. beam on 3 or more posts).
- A purflin is a beam which supports sheeting only.
- A rafter runs down the slope (fall) and supports purlins.
- A headbeam supports the lower edge of the roof where the gutter is located.
- The connection column gives how the beam is supported e.g. by a universal bracket bolted to the side of the post or the beam is bolted with the post behind the beam.
- The tables allow for sheet overhang. The sheet overhang is included in the sheet load width.
- The tables and diagrams apply equally to attached or freestanding structures. The tables give the attachment load where applicable.

Table 5

3.6 TYPICAL FLAT STRUCTURE TYPES

Sample 1

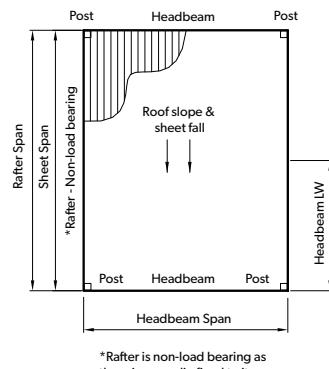

Headbeam, continuous span, sheeting only, attached.

LW = Load Width

Sample 3

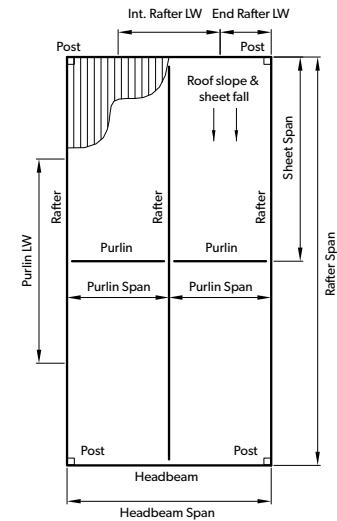

Headbeam, simple span, freestanding.

*Rafter is non-load bearing as there is no purlin fixed to it.

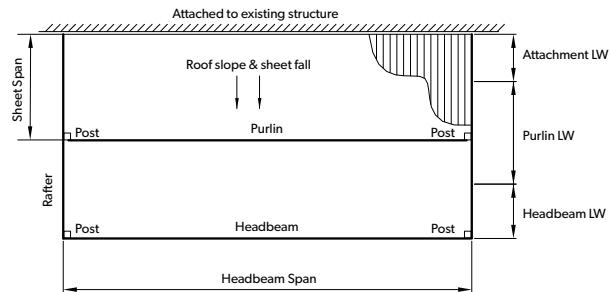

Sample 5

Headbeam supporting rafters, freestanding.

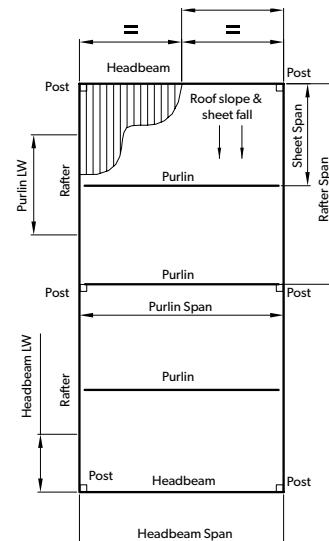

Sample 2

Headbeam, simple span, no intermediate rafters, multiple purlins, attached.

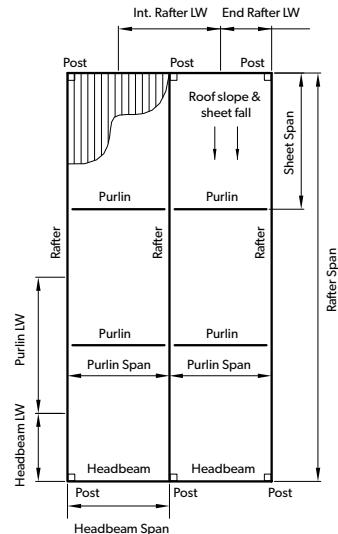

Sample 4

Rafter with multiple purlins, freestanding.

Sample 6

Multiple rafters with multiple purlins, freestanding.

3.7 DESIGN EXAMPLES: FLAT STRUCTURES

EXAMPLES

There are two examples given to show the procedure for designing an awning. Example 1 is a simple attached awning which uses the long spanning capability of FLATDEK® to provide a structure with minimal FIRMLOK® beams.

Example 2 is a bigger freestanding carport with purlins, rafters and headbeams. It has 2 different solutions to illustrate different choices in the awning design configuration.

GENERAL NOTES

The following design parameters are required:

DIMENSIONS

Work out the relevant length, width and height for your structure.

WIND CLASS

Refer to AS4055 or consult your local building authority, engineer or builder to determine if the Wind Category is N1, N2, N3, etc. Refer to the 'Lysaght Design Guide for Wind'.

WIND BLOCKING

From site condition, determine wind blocking (0,1,2,3,4 sides blocked) as defined in Section 1.4.

BEAM CONNECTIONS

Refer to the key diagram and connection details, see different ways to connect FIRMLOK® beams to a support.

ROOF CLADDING

Refer to the cladding selection portion of this guide for claddings and spans. Check sheet overhang if required. Cladding overhang and gutter width must be included in load width calculation when determining beam size and span

Try out different beam sizes, number of beams and connection types to find the most suitable arrangement for your structure. Interpolation between values of the same category is allowed, in the following examples. For simplicity, the next higher value is used.

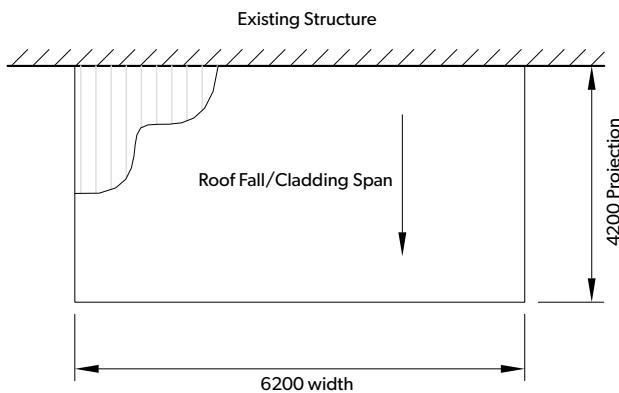

Follow the **Guide** for the design process detailed here.

EXAMPLE 1:

A SIMPLE FLAT AWNING ATTACHED TO THE BACK OF AN EXISTING DWELLING.

Design parameters:

- Wind Class: N3 (W41N)
- Wind Blocking: 1 side blocked
- Projection: 4200
- Width: 6200
- Cladding: No foot traffic, No overhang
- Connection: Beam to side of post

STEP 1: SELECT CLADDING

Refer to roof sheeting span table for wind class N3, 1 side blocked. An economical solution is to try a long span sheeting like FLATDEK® so no purlins or rafters are required. FLATDEK® 0.42mm spans a distance of 4500mm for single/continuous span with no foot traffic, thus FLATDEK® 0.42mm can be used with only a headbeam for the awning. This is a "No Foot Traffic" solution.

STEP 2: DETERMINE BEAM LOAD WIDTH

Half the wind load on the sheeting is taken at the house and the headbeam.

The beam load width is calculated as follows:

Half sheet span $4200 / 2 = 2100$,
sheeting overhang = 0,
total load width = $2100 + 0 = 2100$ mm

STEP 3: DETERMINE BEAM SIZE

Refer to the Beam Table Index for the headbeam tables for 1 span simply supported with connection type: Beam to side of post; refer to **Table 2A**. For an awning width = 6200mm, headbeam load width = 2100 mm, wind class: N3 and wind blocking: 1 side blocked, the following beam spans are:

Beam	Span (mm)
F100	$4050 < 6200$ Not OK
F150	$6250 > 6200$ OK
F200	$7900 > 6200$ OK

Minimum suitable beam size is a F150 beam; adopt a F150 for headbeam. Edge beams are optional at the sides of the awning; they don't carry any load. For uniform appearance, use the same size edge beam as the headbeam; for minimum cost, use a F100 beam.

Posts:

The value next to the beam span in the tables is the reaction (load) at the end of the beam acting on the post. This value can be used to design the post. The wind uplift reaction on the post in this example is 5 kN. Please refer to post manufacturer's data for post capacity.

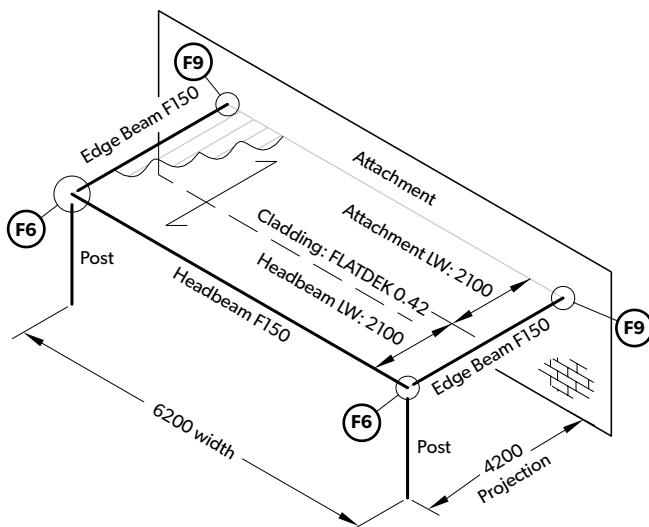

STEP 4 DETERMINE ATTACHMENT LOAD

Use Table 5 to determine the load from the awning transferred to the attached structure. The attachment load is assumed to be uniformly distributed along the attached structure. The attachment load width: $4200\text{mm}/2 = 2100\text{mm}$. For N3 & 1 side blocked, the attachment load is 1.5 kN/m. Use this load to check the attachment member e.g. receiver channel or beam, the fixings and the supporting structure e.g. wall or fascia and house rafters.

STEP 5 CONNECTION DETAILS

Since the Beam to side of post connection was chosen for the awning, refer to connection F6 for Beam to side of post corner detail and F9 for Beam to attachment detail.

DESIGN OUTCOME

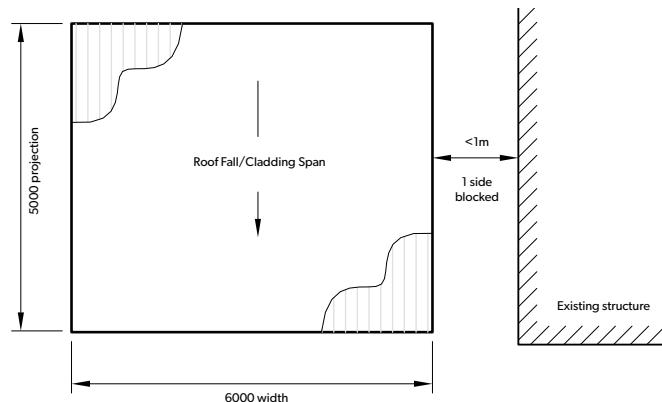

EXAMPLE 2:

A SIMPLE FREE STANDING AWNING NEXT TO AN EXISTING DWELLING.

Design parameters:

- Wind Class: N3 (W41N)
- Wind blocking: 2 sides blocked
- Projection: 6000
- Width: 5000
- Cladding: SPANDEK® 0.42mm, Cladding overhang 0mm
- Connection: Use post behind beam

FREE STANDING AWNING

STEP 1: SELECT CLADDING

For this example, SPANDEK® 0.42mm was chosen. The cladding span tables for N4 wind with 1 side blocked shows that SPANDEK® can span 3000 mm. The awning projection is 5000 mm, hence the number of purlin spacings is: $5000 / 3000 = 1.67$ i.e. 2 spaces; therefore try 1 intermediate rafter.

STEP 2: DETERMINE PURLIN SIZE

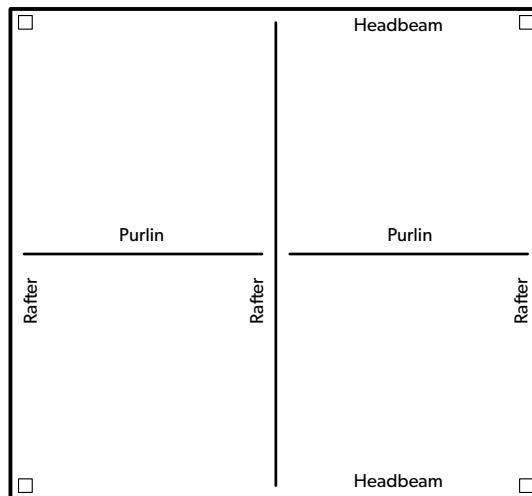

Refer to **Table 1** to look up purlin size and span. The Load width for the purlin is $5000 / 2 = 2500$ hence use 2700 mm without interpolation. In this example, at least 1 row of purlins is required. For N3 and wind blocking on 2 sides, the following single spans are:

Beam	Span (mm)
F100	$2600 < 6000$ Not OK
F150	$4100 < 6000$ Not OK
F200	$5850 < 6000$ Not OK

For a single purlin span arrangement, no span is suitable. Let's add an intermediate rafter to support the purlin and shorten the purlin span.

Now the purlin span is $6000 / 2 = 3000$.

F150 can span $4100 > 3000$ mm, OK.

2 purlins supported by an intermediate rafter.

Another possible solution is to add an extra row of purlins to reduce the load carried by each purlin. This will be explored as an option later.

STEP 3: DETERMINE RAFTER SIZE

Refer to the Beam Table Index for the rafter tables. For 1 span simply supported with a connection type: Post behind beam and supporting 1 row of internal purlins, refer to **Table 3A**.

Intermediate Rafter:

Awning width = 6000 mm, intermediate rafter load width = $6000 / 2 = 3000$ hence use 3000 mm. For Wind Class: N3 and wind blocking on 2 sides, the following rafter spans are:

Beam	Span (mm)
F100	$2400 < 5000$ Not OK
F150	$3900 < 5000$ Not OK
F200	$5400 > 5000$ OK

Minimum suitable rafter size is a F200 beam. Adopt F200 for the rafter.

End Rafter:

Awning width = 6000 mm, perimeter rafter load width = $6000 / 4 = 1500$ hence use 1500 mm.

The available rafter spans are:

Beam	Span (mm)
F100	$3550 < 5000$ Not OK
F150	$5450 > 5000$ OK
F200	$7400 > 5000$ OK

Minimum suitable rafter size is a F150 beam. For economy use a F150.

For universal appearance use a F200 beam since intermediate rafter size is a F200. The reaction is 3 kN.

STEP 4: DETERMINE HEADBEAM SIZE

The front and back headbeams are supporting one internal rafter, therefore use **Table 4A** to find the beam size and span. Note this table is different to headbeam Tables 2A, 2B & 2C, because these tables are designed to only carry load directly from the sheeting. For N3 wind, 2 sides blocked and supporting 1 internal rafter with a span of 5000 mm (use rafter span = 5000 mm), the following headbeam spans are:

Beam	Span (mm)
F100	2750 < 6000 Not OK
F150	4300 < 6000 Not OK
F200	6100 = 6000 OK

The only suitable headbeam size is a F200 beam; therefore adopt a F200 for the headbeam. The reaction is 8.5 kN.

Posts:

The value next to the span in the tables is the reaction load acting on the support of the beam ie. the post. This value together with the load from the headbeam can be used to design the post and footings. The total uplift load on the post is: $8.5 + 3 = 11.5$ kN.

This is conservatively high as the reaction load in the tables is for the maximum span of the beam. A more economical post and footing design can be considered by scaling down the reactions based on the ratio of actual span to maximum span; so the uplift load becomes:

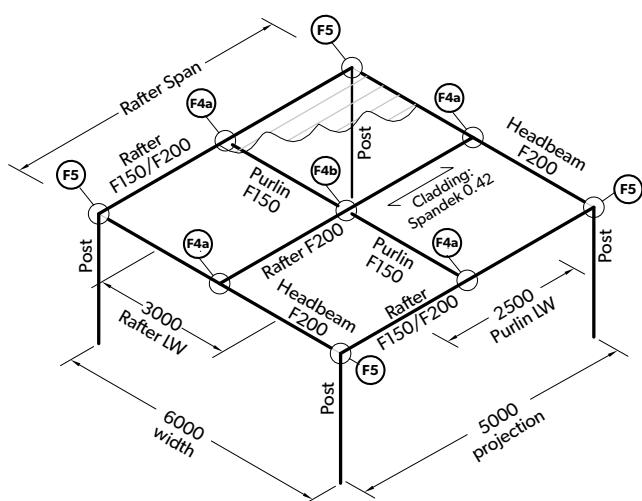

$$3 \times 5000 / 5450 + 8.5 \times 6000 / 6100 = 11.1 \text{ kN (1.11 tonnes)}$$

The post and footing should be designed for these loads and any horizontal wind loads.

STEP 5 CONNECTION DETAILS

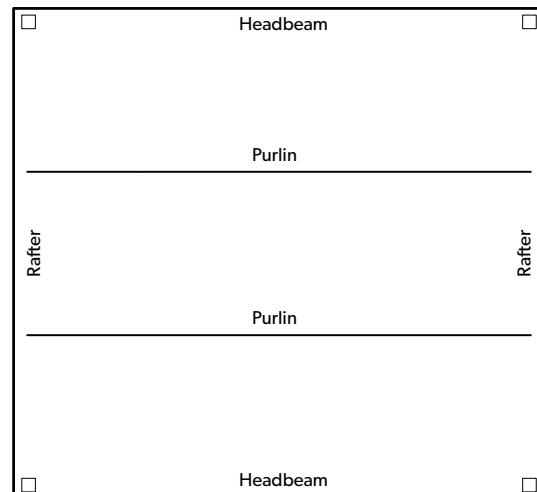

Since a 'post behind beam' connection was selected for the awning, refer to Connection F4 for beam to beam details and connection F5 for corner details.

DESIGN OUTCOME:

ALTERNATE DESIGN: EXAMPLE 2

No intermediate rafter and 1 more purlin

STEP 2 DETERMINE PURLIN SIZE

Continuing from the end of Step 1 in the previous design, now try 2 rows of purlins with no intermediate rafter. Refer to **Table 1** to lookup the purlin size and span. In this case the purlin load width is reduced to $5000 / 3 = 1667$, hence use 1800 mm.

For N3 and 2 sides wind blocking, the following spans are.

Beam	Span (mm)
F100	3200 < 6000 Not OK
F150	5050 < 6000 Not OK
F200	7050 > 6000 OK

The only suitable purlin size is a F200 beam; therefore adopt a F200 for the purlin.

STEP 3 DETERMINE RAFTER SIZE

For 1 rafter with connection type: 'Post behind beam' and supporting 2 purlins, refer to **Table 3B**. For awning projection = 5000, the rafter load width = $6000 / 2 = 3000$ mm, hence use 3000 mm.

For wind class: N3 and wind blocking: 2 sides blocked, the following rafter spans are:

Beam	Span (mm)
F100	2650 < 5000 Not OK
F150	4200 < 5000 Not OK
F200	5900 > 5000 OK

The only suitable beam size is a F200 beam; therefore adopt a F200 for the rafter.

STEP 4 DETERMINE HEADBEAM SIZE

In this design, the head beams are not supporting an internal rafter. The headbeam load width is $(5000 / 3) / 2 = 833$, hence use min. 900mm. For N3 wind, 2 sides blocked, single span headbeam and 'post behind beam' connection, use **Table 2B** to find headbeam size and span.

The available choices are:

Beam	Span (mm)
F100	4150 < 6000 Not OK
F150	6400 > 6000 OK
F200	9000 > 6000 OK

Minimum suitable headbeam size is a F150 beam. For economy, use a F150; for aesthetic appearances use a F200, since the rafter size is a F200.

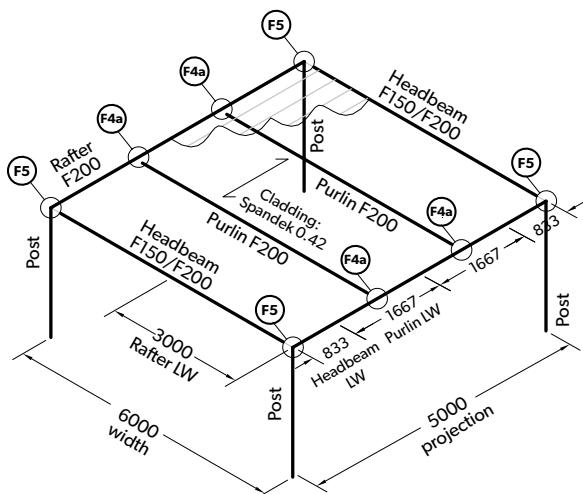

Posts:

The post load is the same as in the previous example.

STEP 5 CONNECTION DETAILS

Since 'Post behind beam' connection was selected for the awning, refer to connection F4 for beam to beam details and connection F5 for the corner beam and post details.

DESIGN OUTCOME:

Note:

Since the purlin spacing is reduced, other claddings could be used. TRIMDEK® has a walkable span of 2000 and SPANDEK® has a walkable span of 1500. Both profiles can take the wind load so there is a choice of sheeting. Based on this, if the roof will be walked on for maintenance then TRIMDEK® should be used. If SPANDEK® is used then the "No Foot Traffic" sign should be fixed to the inside of the headbeams.

PART C

4.0 Pitched Structures

4.1 TABLES FOR PITCHED STRUCTURES

There are 4 rafter load width tables for portal frame and collar-tie rafters for 15° and 22.5° roof pitches.

The tables are used to give the load width of FIRMLOK rafters for different wind classifications, wind blocking and rafter spans. Similarly 2 purlin span tables are provided for pitched structure using similar selection criteria.

EXTRACTION FROM A LOAD WIDTH TABLE

Wind Class	Wind Blocking	Rafter Size	Span (mm) 5000	
No. of int. purlins		0	1	2+
N3	0/1/4 sides	F100	2030	1540
		F150	3950	3150
		F200	5620	5430

The clear span of the rafter/truss between supports.

No. of internal purlins between the eave and apex. For more than 2 int. purlins, select 2+ values.

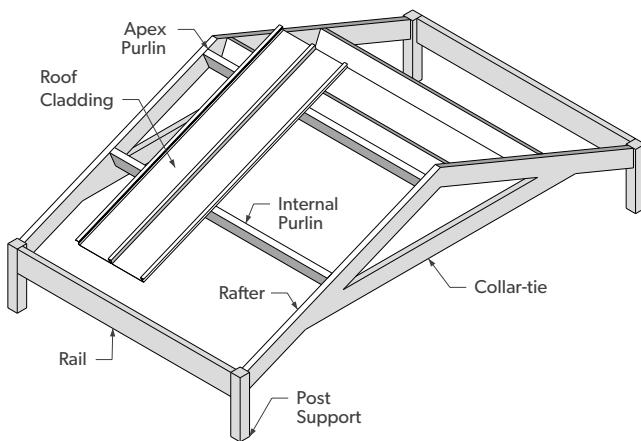

Tributary load width of the rafter/truss frame, see load width tables for more details.

PITCHED STRUCTURES TABLE INDEX

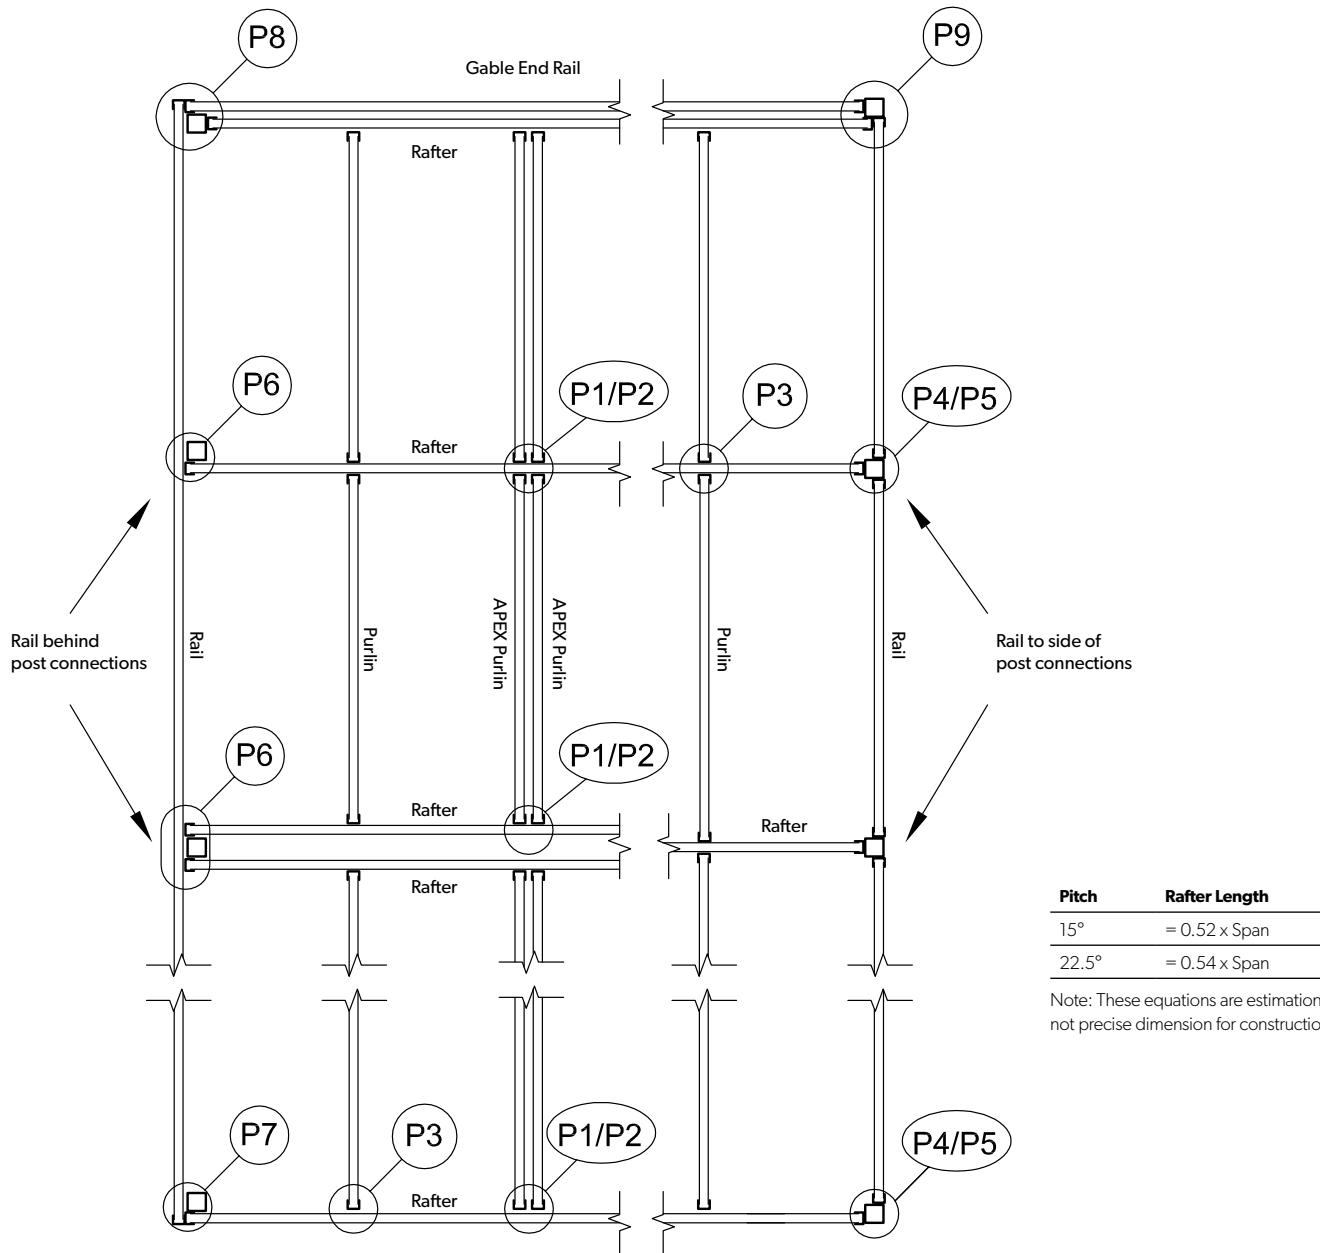

Table	Roof Pitch	Structural Member	Supporting
6A	15°	Collar-tie truss	0, 1, 2+ purlins
6B	22.5°	Collar-tie truss	0, 1, 2+ purlins
7A	15°	Portal frame rafter	0, 1, 2+ purlins
7B	22.5°	Portal frame rafter	0, 1, 2+ purlins
8A	15°	Purlin	Sheeting
8B	22.5°	Purlin	Sheeting

Note: For rail size refer to Pitched structures- component Combination on page 34.

Notes:

1. For intermediate span, use interpolation between the values of the same category.

2. The values in the table are the maximum design load width in mm.

3. Do not use these tables for the design of truss/rafter in roof pitch other than 15 degrees.

4. For truss/rafter with 2 or more rows of internal prulins on each side of ridge, select load width in the "2+" columns.

5. For truss with F150/F200 rafters, use F150 collar-tie, for F100 rafter, use F10011 collar-tie.

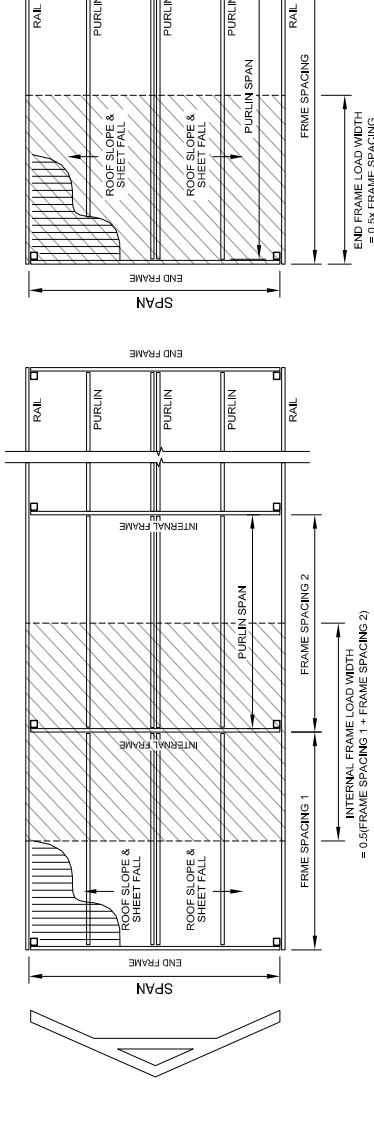

TABLE 6B

Notes:

1. For intermediate span, use interpolation between the values of the same category.

2. The values in the table are the maximum design load width in mm.

3. Do not use these tables for the design of truss/rafter in roof pitch other than 22.5 degrees.

4. For rafter with 2 or more rows of internal purlins on each side of ridge, select load width in the "2+" columns.

5. For truss with F150/F200 rafters, use F150 collar-tie, for F100 rafter, use F100 collar-tie.

Notes:

1. For intermediate span, use interpolation between the values of the same category.

2. The values in the table are the maximum design load width in mm.

3. Do not use these tables for the design of truss/rafter in roof pitch other than 22.5 degrees.

4. For truss/rafter with 2 or more rows of internal purlins on each side of ridge, select load width in the "2+" columns

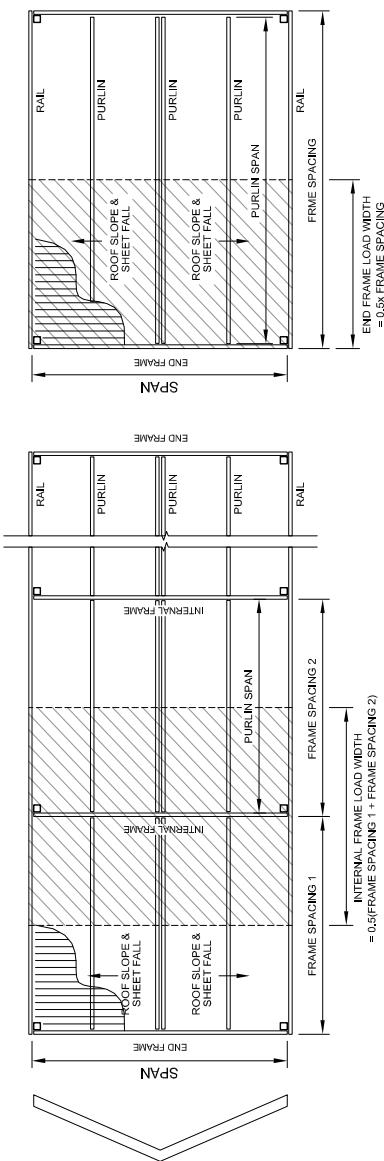

TABLE 8A

Purlin Span and Reaction, Roof Pitch: 15°, Span Type: Simply Supported, Connection: Bracket

Notes:

- For intermediate load width, use interpolation between the values of the same category.
- The 1st value in the table is the purlin span in mm, the 2nd value in the table is the reaction (kN) on the supporting rafter.

- The reaction is based on 1 purlin span and 2 rafter supports. For 2 or more simply span purlins, double (2x) the reaction for internal rafters.

- Purlin span = spacing of rafters.

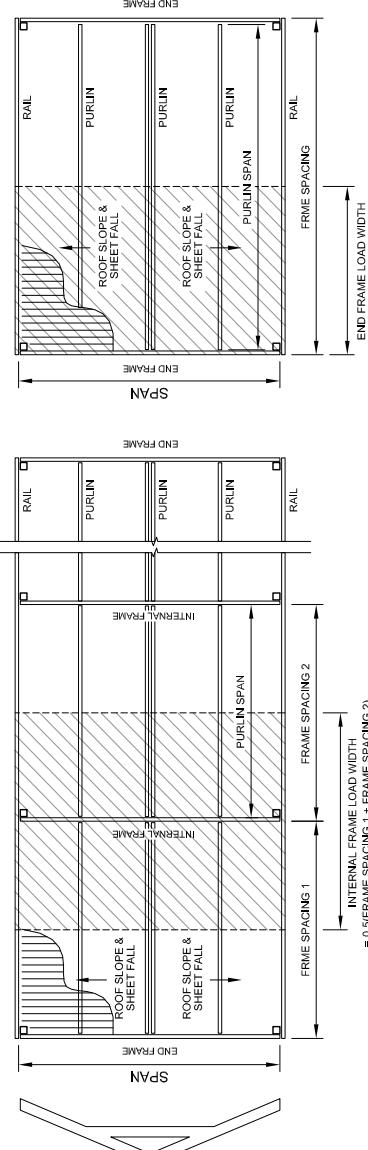

- Do not use these tables for the design of purlin in roof pitch other than 15 degrees.

- The 1st value in the table is the purlin span in mm, the 2nd value in the table is the reaction (kN) on the supporting rafter.

- The reaction is based on 1 purlin span and 2 rafter supports. For 2 or more simply span purlins, double (2x) the reaction for internal rafters.

- Purlin span = spacing of rafters.

- Do not use these tables for the design of purlin in roof pitch other than 15 degrees.

Notes:

- For intermediate load width, use interpolation between the values of the same category.
- The 1st value in the table is the purlin span in mm, the 2nd value in the table is the reaction (kN) on the supporting rafter.

- The reaction is based on 1 purlin span and 2 rafter supports. For 2 or more simply span purlins, double (2x) the reaction for internal rafters.

- Purlin span = spacing of rafters.

- Do not use these tables for the design of purlin in roof pitch other than 22.5 degrees.

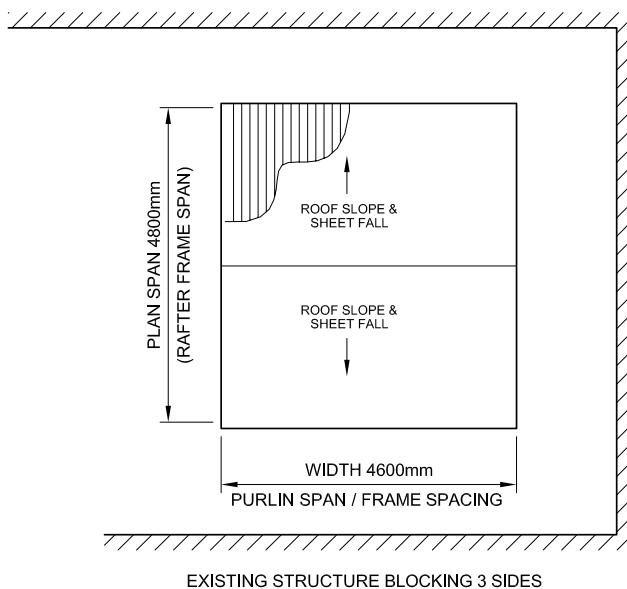

4.5 DESIGN EXAMPLES: PITCHED STRUCTURES

EXAMPLE 3:

A SIMPLE PITCHED ROOF FREESTANDING AWNING WITH 2 COLLAR-TIE FRAMES.

Design Parameters:

- Wind Class: N4 (W50N)
- Wind Blocking: 3 side blocked
- Building Projection (Rafter Span): 4800mm
- Building Width (Frame Spacing/Purlin Span): 4600mm
- Roof Pitch: 15°
- Cladding: FLATDEK® II, No foot traffic
- Connection: Rail behind post

STEP 1: SELECT CLADDING

Cladding span = $0.52 \times$ rafter span = $0.52 \times 4800\text{mm} = 2490\text{mm}$. From roof sheeting span table for wind class N4, 3 side blocked, pitched roof and no foot traffic condition, FLATDEK® II 0.42mm can span up to 3000mm without intermediate support, which is suitable for this example.

STEP 2: DETERMINE RAFTER SIZE

For collar-tie truss with 15° roof pitch, use **Table 6A** to select rafter size and frame spacing. From step 1, we know FLATDEK® II 0.42mm can span between the eave and apex without intermediate support. So for wind class N4, 3 sides blocked, 4800mm rafter span (use 5000mm) and 0 row of intermediate purlin, the following collar tie truss load width are available:

Rafter	Truss load width (mm)
F10011	$1080 < 4600/2$ Not OK
F15015	$2200 < 4600/2$ Not OK
F20020	$2760 > 4600/2$ OK

For an overall structure width of 4600mm, the load width of each end rafter frame is $4600/2 = 2300\text{mm}$. therefore F20020 with load width of 2760mm is suitable for this case. The collar-tie strut size is F15015 for 150 or 200 rafters.

STEP 3: DETERMINE PURLIN SIZE

For 15° roof pitch, use **Table 8A** to select purlin size. With no intermediate purlin, the apex/rail purlin load width is $4800/4 = 1200\text{mm}$, the following purlin spans are available.

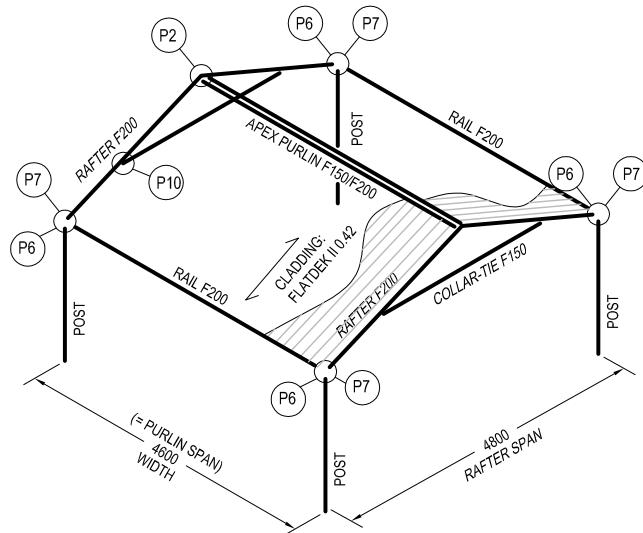

Purlin	Purlin span (mm)
F10011	$3000 < 4600$ Not OK
F15015	$4650 > 4600$ OK
F20020	$6450 > 4600$ OK

Since the collar-tie rafter size is F20020, therefore F15015 and F20020 are both suitable for apex purlins. The rail size should be F20020 as detailed on page 34.

STEP 4: CONNECTION DETAILS

For Apex connection refer to Connection detail P2. For Collar tie to rafter connection refer to detail P10. For rafter to post connection refer to detail P7. For Rail behind Post Connection refer to detail P6.

DESIGN OUTCOME

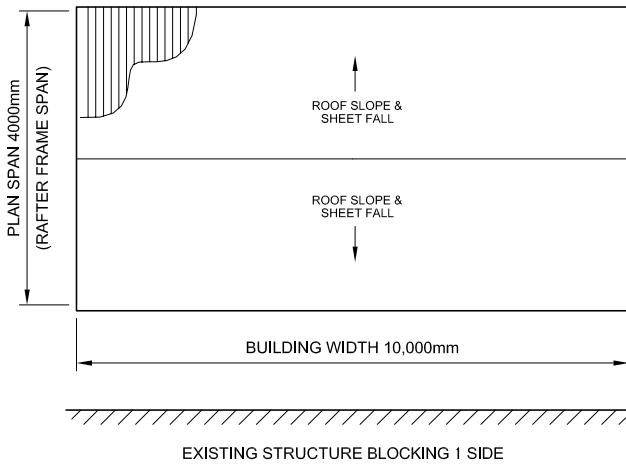

EXAMPLE 4:

A SIMPLE PITCHED ROOF FREESTANDING AWNING WITH 3 PORTAL FRAME RAFTERS.

Design Parameters:

- Wind Class: N3 (W41N)
- Wind Blocking: 1 side blocked
- Building Projection (Rafter Span): 4000mm
- Building Width: 10000mm
- Roof Pitch: 15°
- Cladding: CUSTOM ORB®, No foot traffic
- Connection: Rail to side of post

STEP 1: SELECT CLADDING

Cladding span = $0.52 \times \text{rafter span} = 0.52 \times 4000\text{mm} = 2080\text{mm}$. From roof sheeting span table for wind class N3, 1 side blocked, pitched roof and no foot traffic condition, CUSTOM ORB® 0.42mm can span up to 1800mm < 2080mm, therefore provide 1 row of internal purlin between rail and apex, now the cladding span is $2080 / 2 = 1040\text{mm} < 1800\text{mm}$, ok.

STEP 2: DETERMINE RAFTER SIZE

For portal frame rafter with 15° roof pitch, use **Table 7A** to select rafter size and frame spacing. It is unlikely that 2 frames will be able to support a building width of 10m. Therefore start design selection assuming 3 frames are required. Therefore the internal frame load width is $10,000\text{mm} / 2 = 5000\text{mm}$ and the end frame load width is $5000 / 2 = 2500\text{mm}$. From step 1, we know CUSTOM ORB® 0.42mm requires 1 row of internal purlins. So for wind class N3, 1 sides blocked, 4000mm rafter span and 1 row of internal purlin, the following rafter load width are available:

Rafter	Truss load width (mm)
F10011:	$1850 < 5000$, Not Ok
F15015:	$5630 > 5000$, Ok
F20020:	$9000 > 5000$, Ok

Therefore F15015 rafter is suitable for both end and internal frames. Collar-tie member is not required for portal frame rafter.

STEP 3: DETERMINE PURLIN SIZE

For 15° roof pitch, use **Table 8A** to select purlin size. With 1 intermediate purlin as determined from Step 1, the purlin load width is 1040mm (use 1200mm) and the purlin span is 5000mm, the following purlin spans are available.

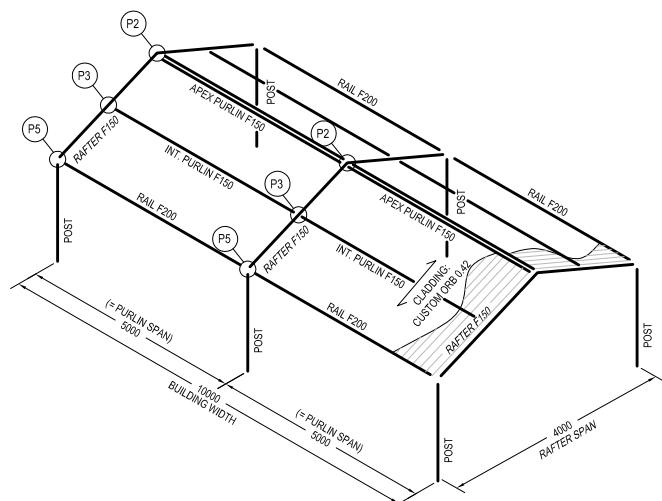

Purlin	Purlin span (mm)
F10011:	$4850 < 5000$, Not Ok
F15015:	$7050 > 5000$, Ok
F20020:	$8750 > 5000$, Ok

Therefore F15015 and F20020 are both suitable. The rail size should be F20020 as detailed on page 34.

STEP 4: CONNECTION DETAILS

For apex connection refer to connection detail P2. For rafter to post and post to rail connections refer to detail P5. For purlin connection refer to detail P3.
